

## **2010 Evaluation of Herbicide Systems in Soybean at Rochester, MN**

Breitenbach, Fritz R., Lisa M. Behnken, Ryan P. Miller, Jeffrey L. Gunsolus, Thomas Hoverstad

The objective of this trial was to evaluate the performance of herbicide systems for weed control in soybeans in southeastern Minnesota. The research site was a Lawler loam series with a pH of 6.6, O.M. of 2.8%, and soil test P and K levels of 46 ppm and 150 ppm, respectively. The field was spring chisel plowed, disked and field cultivated once prior to planting. The soybean hybrid, Pioneer 91Y92, was planted on May 15, 2009 at a depth of 1.5 inches in 30 inch rows at 150,000 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) and postemergence (POST) treatments were applied with a tractor-mounted sprayer delivering 20 gpa at 32 psi using Turbo Tee 11002 nozzles. Evaluations of the plot were taken on June 7, 15, 23, 29, July 13, and September 17, 2010. Application dates, environmental conditions, and weed stages are listed below. The center two rows of each plot were machine harvested on October 1, 2010.

**SUMMARY:** Dry weather following planting resulted in poorer than expected crop emergence. The reduction in stand was reflected in frequent stand skips of 12 inches or more. Final plant stands of less than 100,000 plants per acre were evident throughout the trial.

Overall weed control was very good to excellent for all treatments. Two soil applied herbicides provided better than 90 percent control of giant ragweed, Authority First (6.4 oz rate) and Gangster (2.0 and 2.4 oz rate). Two treatments provided reduced control of giant ragweed, Warrant + Roundup OriginalMax (POST I) and the conventional herbicide program of Gangster followed by Raptor + Select.

The soil applied Prefix treatment provided reduced control of common lambsquarters when compared to the other soil applied treatments. The Warrant + Roundup OriginalMax (POST I) treatment and the Roundup WeatherMax (POST II) treatment also had reduced common lambsquarters control when compared to the rest of the treatments.

Common waterhemp control was generally lower with the PRE / POST II programs compared to the other programs, except for the POST II only Roundup WeatherMax treatment which achieved only 93% control.

Herbicide injury was observed with post emergence application of PPO and ALS chemistries. No statistical yield decreases were observed, however, injury from the ALS chemistry appears to have had a potentially detrimental effect. (University of Minnesota Extension Regional Office, Rochester)
