

## **Performance of Ignite 280 Herbicide Systems for Weed Control in Soybean at Lamberton, MN, in 2010.**

Stahl, Liz A., Fritz R. Breitenbach, Lisa M. Behnken, Ryan P. Miller, Jeffrey L. Gunsolus, Jodie Getting

The objective of this trial was to evaluate the performance of Ignite 280 herbicide programs for weed control in soybeans in southwestern Minnesota. The research site was a Normania Loam series with a pH of 6.1, O.M of 3.8%. The field was fall chisel plowed, and spring field cultivated once prior to planting. The soybean variety, Stine 23LA08-Var S080137, was planted on May 18, 2010, in 30 inch rows at 160,000 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) and postemergence (POST) treatments were applied with a tractor-mounted sprayer delivering 20 gpa at 40 psi using 8002 flat fan nozzles. Evaluations of the plots were taken on June 16, 24, July 15, and September 28, 2010. Application dates, environmental conditions, and weed stages are listed below. The center two rows of each plot were machine harvested on October 11, 2010.

### **SUMMARY:**

The statistically highest redroot pigweed and tall waterhemp control were achieved with the following sequential PRE followed by POST treatments, Valor followed by Ignite, Fierce followed by Ignite, Prefix followed by Ignite, Gangster followed by Ignite, and Authority First followed by Ignite.

Two POST only combinations also provided redroot pigweed and tall waterhemp control statistically equal to the maximum, Ignite + Flexstar and Ignite + Prefix. All three of the POST sequential treatments of Ignite 280 provided maximum control of redroot pigweed and tall waterhemp.

The statistically highest yellow foxtail and barnyard grass control were achieved with the following sequential PRE followed by POST treatments, Valor followed by Ignite, Optill followed by Ignite, Fierce followed by Ignite, Prefix followed by Ignite, Gangster followed by Ignite, Authority First followed by Ignite and Sonic followed by Ignite. All of the POST only

combinations resulted in statistically lower control of yellow foxtail and barnyard grass. All three of the POST sequential treatments of Ignite 280 provided the maximum level of control for yellow foxtail and barnyard grass.

POST treatments where only Ignite was applied resulted in injury levels ranging from 25-38 percent. The highest crop injury was observed in the POST only combinations of Ignite + Prefix, Ignite + Cobra, and Ignite + Harmony, causing crop injury levels of over 50%. (University of Minnesota Extension).
