

2013 Evaluation of Weed Management Systems in Field Corn in Rochester, MN.

Breitenbach, Fritz, R., Lisa M. Behnken, Jerffrey R. Gunsolus, and Thomas Hoverstad

The objective of this trial was to evaluate the performance of herbicide programs for weed control in field corn in southeastern Minnesota. The research site was a Lawler loam series with a pH of 6.4, O.M. of 2.3%, and soil test P and K levels of 38 ppm and 97 ppm, respectively. Spring fertilizer was broadcast on April 26, 2013 ahead of planting at a rate of 130-26-120-24 (N-P-K-S). The field was spring, disked and field cultivated once prior to planting. The corn hybrid, Pioneer 9917AMX, was planted on May 14, 2013 at a depth of 1.5 inches in 30 inch rows at a rate of 32,000 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) and postemergence (POST) treatments were applied with a tractor-mounted sprayer delivering 15 gpa at 32 psi using TeeJet 11002 air induction flat spray tips for PRE treatments, and Turbo TeeJet 11002 wide angle flat spray tip nozzles for POST applications. Evaluations of the plots were taken on June 7 and 17, July 5, and September 25, 2013. The center two rows of each plot were machine harvested on November 8, 2013. Application dates, environmental conditions, and weed stages can be found in Table 1. Performance ratings for giant ragweed control, common lambsquarters control, common waterhemp control, grass control, and plant injury can be found in Tables 2 through 6, respectively. (University of Minnesota Extension Regional Office, Rochester)
