

Evaluating the effectiveness of the pyroxasulfone based herbicide Anthem and tank mixtures with other potential broadleaf herbicides for improved weed control in field corn

Breitenbach, Fritz R., Lisa M. Behnken, Ryan P. Miller, Maria Wingert and Matthew Welter

The objective of this trial was to evaluate preemergence and postemergence proxasulfone based systems for weed control in field corn in southeastern Minnesota. The research site was a Lawler loam series with a pH of 6.7, O.M. of 2.5%, and soil test P and K levels of 69 ppm and 180 ppm, respectively. Spring fertilizer was broadcast on April 26 ahead of planting at a rate of 130-26-120-24 (N-P-K-S). The field was spring disked and field cultivated once prior to planting. The corn hybrid, Pioneer P9917AMX (99 day), was planted on May 13, 2013 at a depth of 1.5 inches in 30 inch rows at a rate of 32,000 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) and postemergence (POST) treatments were applied with a tractor-mounted sprayer delivering 15 GPA at 32 psi using TeeJet 11002 air induction flat spray tips for PRE treatments, and Turbo TeeJet 11002 wide angle flat spray tip nozzles for POST applications. Evaluations of the plots were taken on June 4, 17, 26, and July 10, 2013. The center two rows of each plot were machine harvested on November 8, 2013. Application dates, environmental conditions, and weed stages are listed below in Table 1. Herbicide performance for giant ragweed, common lambsquarters, common waterhemp and grasses, plus plant injury ratings can be seen in Tables 2 through 6 respectively.
