

2013 Evaluation of Herbicide Systems in Soybeans at Rochester, MN

Behnken, Lisa M., Fritz R. Breitenbach, Ryan P. Miller, Jeffrey Gunsolus, and Thomas Hoverstad

The objective of this trial was to evaluate the performance of herbicide systems for weed control in soybeans in southeastern Minnesota. The research site was a Lawler loam series with a pH of 6.6, O.M. of 2.6%, and soil test P and K levels of 62 ppm and 188 ppm, respectively. The field was fall moldboard plowed, and disked and field cultivated once prior to planting in the spring. The soybean variety Stine 22RC22 was planted on May 24, 2013 at a depth of 1.5 inches in 30 inch rows at a rate of 165,500 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) and postemergence (POST) treatments were applied with a tractor-mounted sprayer delivering 20 gpa at 32 psi using TeeJet 11002 air induction flat spray tips for PRE treatments, and Turbo TeeJet 11002 wide angle flat spray tip nozzles for POST applications. Evaluations of the plot were taken on June 17 and 26, and July 5, 15, and 24 and September 25. The center two rows of each plot were machine harvested on October 26, 2013. Application dates, environmental conditions, and weed stages are listed in Table 1. Herbicide performance for giant ragweed, common lambsquarters, common waterhemp and giant foxtail control, plus plant injury ratings are found in Tables 2 through 6 respectively. (University of Minnesota Extension Regional Office, Rochester)

Table 1. Application timing, plant stage, environmental conditions.

Date	5/24	6/14	6/27	7/11
Treatment	PRE	POST I	POST II	POST III
Temperature (F)				
Air	64	75	81	75
