

## **Comparisons of Herbicide Systems for Weed Control in Field Corn at Rochester, MN in 2016**

Behnken, Lisa M., Fritz R. Breitenbach, Jeffery Gunsolus, and Thomas Hoverstad

The objective of this trial was to evaluate herbicide systems in field corn in southeastern Minnesota. The research site was a loamy sand series with a pH of 6.7, O.M. of 2.1%, and soil test P and K levels of 29 ppm and 167 ppm, respectively. Fall fertilizer was broadcast on November 5, 2015 at a rate of 0-46-180-0 lbs/A. Fertilizer was also applied in the spring, ahead of a planting, on April 16, 2016 at a rate of 115-0-0-24 (N-P-K-S) lbs/A. Additional nitrogen was applied on May (25 lbs/A) and on June (36 lbs/A). The field was disked and field cultivated once prior to planting. The previous crop was soybean. The corn hybrid, DEKALB DKC49-72RIB, was planted April 25, 2016 at a depth of 1.5 inches in 30 inch rows at a rate of 32,000 seeds per acre. A randomized complete block design was used with four replications. Preemergence (PRE) treatments were applied with a tractor-mounted sprayer delivering 15 gpa at 30 psi using TTI-11002 tips. Postemergence (POST) were applied at 15 gpa and 30 PSI using TTI 11002 tips for systemic materials and TTI J60 - 11002 tips for contact herbicides. Evaluations of the plots were taken May 19, May 24, May 31, June 6, June 15, and September 15. The center two rows of each plot were machine harvested on October 19, 2016. Application dates, environmental conditions and weed stages can be found in Table 1. Performance ratings for giant ragweed, common lambsquarters, common waterhemp and grass control can be found in Tables 2 through 5 respectively. Minor crop injury (speckling) was only observed immediately after application in two postemergence treatments, 19 and 21 (data not shown). (University of Minnesota Extension Regional Office, Rochester.)

### **DISCUSSION**

Twenty of the twenty-two or (91%) of the treatments had a PRE herbicide component. Four of them (23%) included atrazine (SOA 5). There were eight different SOAs (2, 4, 5, 9, 10, 14, 15 and 27) included in this trial. Three of the soil applied programs provided 93-96% control of giant ragweed, Acuron, Corvus and Resicore. Six of the soil applied programs provided 89-92% control of giant ragweed, full rates of Surestart and Verdict, split rates of Acuron Flexi and Resicore, and a tankmix of Breakfree NXT Lite + Instigate. 95% of the herbicide programs provided excellent control of the small seeded broadleaf weeds, waterhemp and common lambsquarters. Grass control was 98 – 99% for twenty of the herbicide programs.

One of the key values of using a preemergence herbicide is to extend the window of opportunity to make the postemergence herbicide applications. In regards to giant ragweed, if no PRE was used, the POST herbicides needed to be applied 25 days after planting for effective control. If the PRE herbicide was weak on Giant ragweed, (%) control, the post herbicide was applied 29 days after planting. If the PRE herbicide provided very good to excellent control of giant ragweed (85-98%?), the window widened to 37 to 43 days after planting before the POST herbicide needed to be applied to control later emerging weeds. The use of a robust PRE expanded the window to apply the POST herbicide by an additional 12 to 18 days compared to the programs not using a PRE herbicide.
