

Hard red spring wheat and barley tolerance to postemergence herbicides at Crookston, MN - 2004. Durgan, Beverly R., Jochum J. Wiersma, James H. Cameron, and Douglas W. Miller. This experiment was designed to evaluate the tolerance of selected Hard Red Spring Wheat (HRSW) and barley varieties to various postemergence herbicides and a plant growth regulator. The experiment was conducted at Crookston, MN on a Donaldson/Wheaton loam. Following soybeans, the experimental area was chisel plowed in the fall of 2003. In the spring of 2004, the experimental area was tilled with a field cultivator to prepare the seedbed. . The HRSW varieties 'Alsen', 'Briggs', 'Freyr', 'Granger', 'Granite', 'Hanna', 'HJ98', 'Knudson', 'NorPro', 'Oklee', and 'Reeder' and the spring barley varieties 'Lacey' and 'Robust' were seeded on April 27 at 105 lbs/A and 98 lbs/A for wheat and barley, respectively. All herbicide treatments were applied with a CO<sub>2</sub> powered backpack type sprayer delivering 10 gpa at 30 psi using 80015 flat fan nozzles. The experimental design was a strip plot with three replications. Varieties were seeded in strips randomized within each replication. Herbicide treatments were applied across all varieties. Each herbicide x variety plot was 8 by 8 ft. Herbicide treatments were applied June 9. Environmental conditions are listed below. Crop injury was rated visually. Plant heights and grain yield were measured. Data is summarized by variety and is presented in the tables 1 through 7.
