

Hard red spring wheat and barley tolerance to postemergence herbicides at Rosemount,

MN - 2008. Durgan, Beverly R., Krishona Martinson, and Douglas Miller. This experiment was designed to evaluate the tolerance of selected Hard Red Spring Wheat (HRSW) and barley varieties to various postemergence herbicides. The experiment was conducted at Rosemount, MN on a Waukegan silt loam soil. Following soybeans, the experimental area was chisel plowed in the fall of 2007. In the spring of 2008, the area received 75 lbs/A N then was field cultivated twice. The HRSW varieties 'Ada', 'Faller', 'Glenn', 'Hat Trick', 'Howard', 'Kelby', 'Knudson', 'Kuntz', 'Oklee', 'RB-07', 'Tom', and 'Traverse' and the spring barley varieties 'Rasmussen' and 'Stellar' were seeded on May 1 at 85 lb/A and 90 lbs/A for HRSW and spring barley, respectively. Herbicide treatments were applied to a 7.5 ft strip with a tractor mounted sprayer delivering 10 gpa at 35 psi using 11001 flat-fan nozzles. The experimental design was a strip plot with three replications. Varieties were seeded in strips randomized within each replication. Herbicide treatments were applied across all varieties. Each herbicide x variety plot was 12 feet wide by 12 feet long. Herbicide treatments were applied June 4. Environmental conditions at application are listed below. Crop injury was visually rated. Crop height and yields were measured. Data is summarized by variety and is presented in Tables 1 to 7.

Treatment Date **June 4**

Temperature (°F)	
Air	65-67
Soil	70
Soil Moisture	moist
